

Output of Task #1

First make sure the download path is empty which is source code file:

Then this is the file which will be processed :

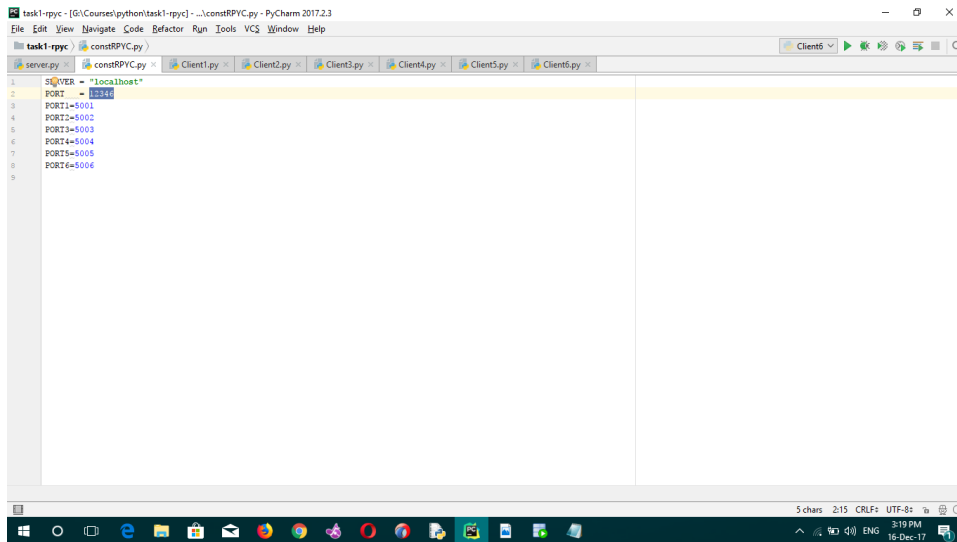

The path of this file is : C:/Users/Ahmed Saied/Desktop/aa.txt

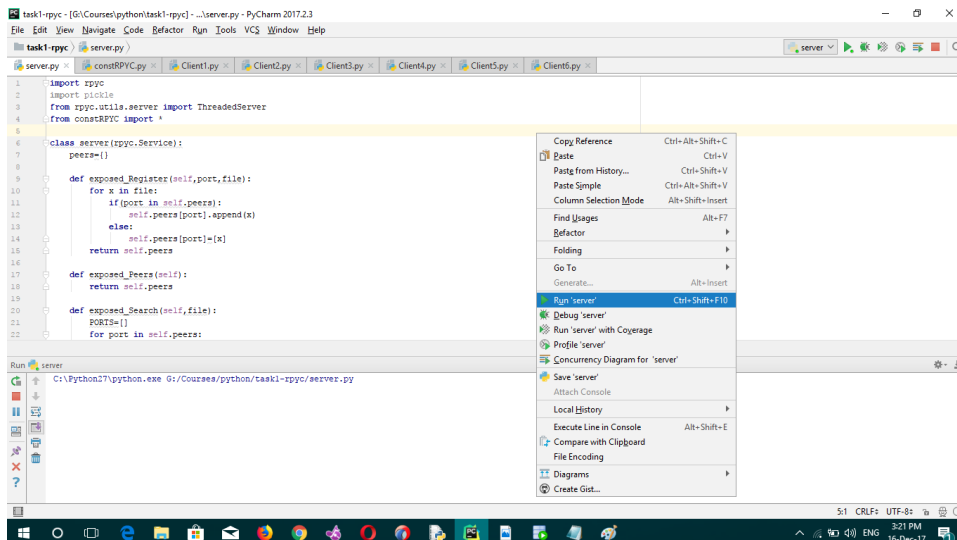

***you can choose what you need but make sure to send the full path**

Make sure of the configuration of the server and the peers :

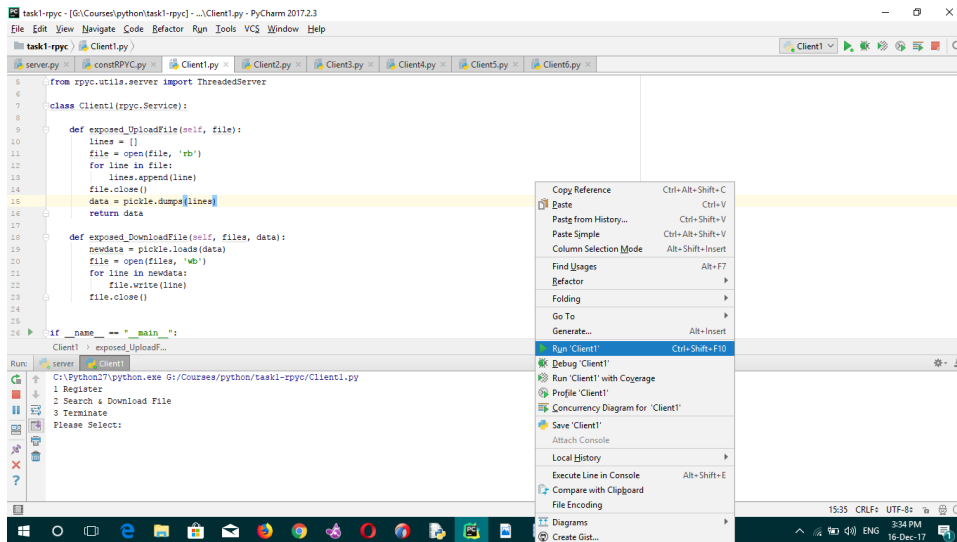

You can read the manual if need

Run the server :

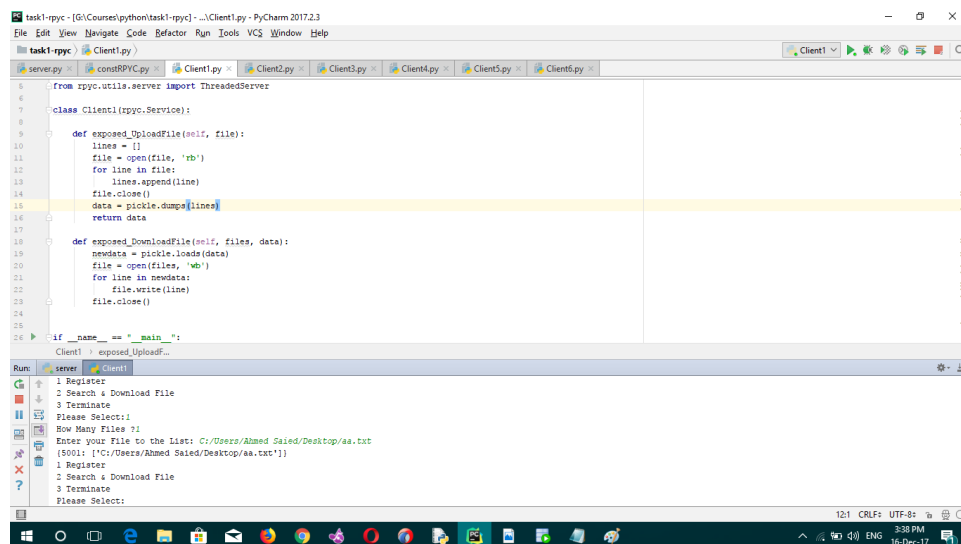

Run any peer you would like :

Well, you can register your file now:

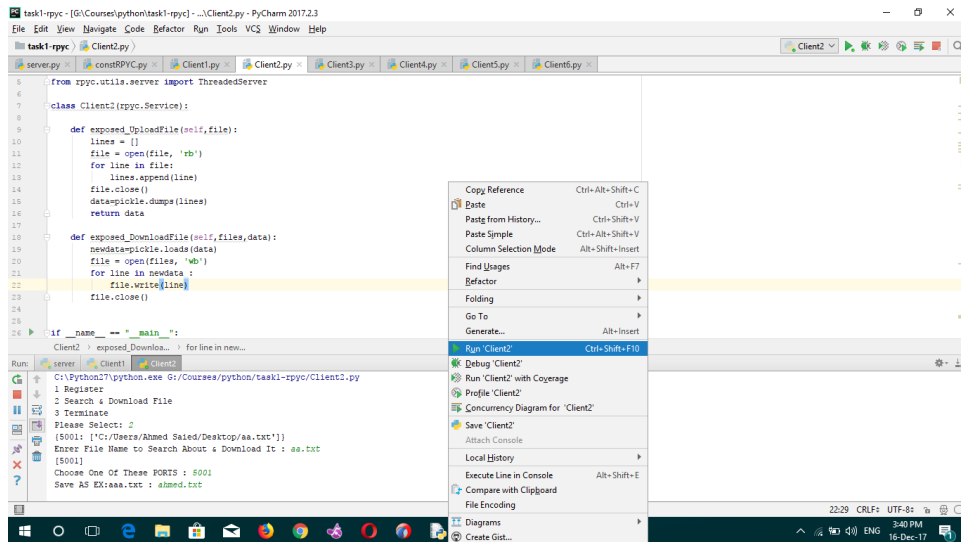

After choosing register and how many files you would like to be registered

Give the full path of this file

Run another peer like client2 and choose download file from the menu:

Choose the name of file just the name not the full path. Then if there is another port have the same name of that file you should choose which port to download it from. Finally rename the file

Then check the download path again :
